

PROJECT DOCUMENTATION

Project Title

Static Webpage Design

Student Details

Name: Unnati Sharma

Program: B.Tech CSE

Organization: DecodeLabs Industrial Training Program

Introduction

This project focuses on designing and developing a static webpage using HTML and CSS. The webpage follows modern frontend development practices including semantic HTML structure, responsive design principles, CSS Grid, and Flexbox layouts.

The project serves as a foundation for understanding webpage structure, content organization, and styling techniques.

Objectives

- Develop a static webpage using HTML5 and CSS3.
 - Implement semantic HTML elements.
 - Create a responsive and visually appealing layout.
 - Apply CSS Grid and Flexbox concepts.
 - Build reusable and maintainable code.
-

Requirements Implemented

Semantic HTML

The webpage uses semantic tags such as:

- Header
- Navigation
- Main

- Section
- Article
- Footer

Layout Design

The webpage consists of:

1. Header Section
2. Hero Section
3. Content Grid Section
4. Footer Section

Styling

An external CSS file has been used for styling.

Key styling techniques include:

- CSS Grid
 - Flexbox
 - Consistent spacing and typography
-

Methodology

Header

The header contains:

- Logo container
- Navigation menu

Flexbox is used to align the elements horizontally.

Hero Section

The hero section contains:

- Main headline
- Call-to-action button

The content is centered both vertically and horizontally.

Content Grid

The content section uses CSS Grid to display four cards.

Each card contains:

- Image
- Title
- Description

Footer

The footer contains:

- Contact information
- Center aligned content

Output Screenshots

Challenges Faced

- Creating a balanced layout structure.
- Implementing responsive grid behavior.
- Maintaining semantic HTML standards.

Learning Outcomes

Through this project, the following concepts were learned:

- Semantic HTML5
- CSS Grid
- Flexbox
- Responsive Design
- Webpage Structure
- UI Layout Development

Conclusion

The Static Webpage Design project successfully demonstrates the use of HTML and CSS to create a structured, responsive, and visually appealing webpage. The project provides a strong foundation in frontend development concepts and prepares the developer for more advanced web development projects.
